

Title - Generative AI in Movie Production

Team Member – Pawan Chauhan, Gopal Jaiswal

Brief on the Project

This research explores the role of Generative Artificial Intelligence (AI) in transforming the process of movie production. Traditional filmmaking involves high costs, time, and human resources for tasks such as scriptwriting, video editing, visual effects, and animation. Generative AI models like text-to-video diffusion models, large language models (LLMs), and deepfake technologies offer new opportunities to automate and enhance these processes.

The project will investigate:

- How AI tools can generate scripts, dialogues, and storyboards.
- The application of text-to-video generation for scene creation.
- The use of AI in visual effects (VFX), editing, and animation.
- Ethical challenges such as creativity, ownership, and authenticity in AI-generated movies.

Proposed Development Tools / Methods

- Development Tools
 1. Text-to-Video / Image Tools
 - Runway ML, Pika Labs, Stable Video Diffusion, OpenAI Sora (if access available).
 2. Script & Dialogue Generation
 - OpenAI GPT models, Claude, LLaMA-based LLMs.
 3. Image & Visual Effects
 - Stable Diffusion, MidJourney, DALL·E (for storyboard/scene generation).
 4. Editing & Post-Production
 - Adobe Premiere Pro with AI plugins, DaVinci Resolve with AI tools.
 5. Programming Frameworks (for experiments)
 - Python, PyTorch, TensorFlow (for training small AI models).
